

eShram knows who India's workers are. Not where they are.

It records a worker once at enrolment, against a home address. They migrate; the record stays. Welfare goes there and never arrives.

So this is not tracking. It is presence the worker switches on, because it pays them back.

Hatched districts are withheld to protect under ten workers.

31.9 cr

enrolled on eShram, Aug 2026

66%

of modelled workers are away from home

18%

modelled without a smartphone

Why a tracking app fails

- **Low literacy, twenty languages.** Text-heavy screens exclude the people they serve.
- **One in five has no smartphone.**
- **Worksites have no signal.**
- **No reason to update a database that follows you.**

What the worker gets back

- **Ration that travels** with them.
- **Proof of employment** for a claim or the next job.
- **Warnings** in the language they read.
- **Control.** Consent is per purpose, revocable, and every lookup is logged where they can see it.

Three ways to mark presence

Scan the worksite code Employer shows a QR. Scanning attests presence and builds the muster roll.	One tap, geofenced No typing, no reading. Coordinates verify the boundary, then go.	Missed call For a feature phone. The tower gives a district.
--	--	---

Offline first. Attestations queue on the device and send themselves when a signal returns. 28% arrived that way.

The attestation waits on the phone.

Officials see flows. Seeing a person needs a reason.

- **District granularity.** Coordinates verify a worksite boundary, then are discarded after seven days.
- **Suppression below ten.** A single withheld cell can be recovered by subtraction, so it takes a neighbour with it.
- **Gated and logged.** Seeing an individual needs a recorded basis, and they can read who looked.

Corridors publish freely. Individuals never do.

suppression floor

Flood declared — Surat

The state needs a headcount and a language list, now.

412 present, every one from another state. 276 need the warning in Odia, not Gujarati. 68 have no smartphone.

And 10 withdrew consent, so the system does not contact them — even in a flood. A consent switch that bends in an emergency was never consent.

Live drill-down, under the suppression gate.

Working prototype, not a mockup

Built solo, and running today

- **One deployable system.** Next.js and PostgreSQL. The worker app installs as a PWA — no app store.
- **Real geography.** 726 districts, 14 corridors from Census and Economic Survey data.
- **Honest boundary.** eShram UAN auth sits behind a mocked interface. No Aadhaar data stored.
- **Verified, not asserted.** Privacy guarantees and the offline queue ship with tests.
